ACADEMIC PROJECT

Title: “Cloud Storage Security Using Decentralized Access Control”

Duration: December 2015 to May 2016

Brief outline:

We propose a new scheme for secure cloud storage using decentralized access control that supports anonymous/unacknowledged authentication. In this, the cloud verifies the authenticity without knowing the user's details or identity before storing data. We also added feature of access policy control or authority in which only valid users are able to decrypt the stored information. Our scheme prevents replay attacks and supports creation, reading, and writing or modification data stored in the cloud. We also address user revocation policy.

Objective: To improve the results of Confidentiality of Data, Hiding the details of the user/client, without knowing the details of users we can store a data on cloud, maintain the anonymous authentication.
